Discover application performance issues before your business does with

Flowmon APM

Satisfied users and customers are a core business advantage. When applications play a key role in their behavior, ensuring the smooth running of critical systems is a must. Facing this challenge, IT experts benefit from Flowmon APM when troubleshooting application issues and driving user experience proactively.

Flowmon APM

Application performance untangled

Flowmon APM proactively monitors your business critical applications from the end user perspective so you always know how they stack up. With no agents on servers and no changes in configuration you can discover application availability issues, slow response times and performance bottlenecks. Discover everything before they affect your customers and employees.

Flowmon APM specializes in HTTP/S and database applications and works at network level, which is the only non-intrusive way of measuring real user experience. It measures delays caused by the network, web application and database and for every user, every transaction in real-time.

Malfunctional internal applications slow down the work of employees, greatly impacting their productivity. Flowmon APM saves costs on troubleshooting by directing administrators to the right area of interest, provides hard data for effective capacity planning and measures SLA parameters of your 3rd party suppliers.

To measure application availibility and response times even when no real users are active we offer APM Transaction Generator - the easiest way of scheduled syntetic testing and SLA reporting.

Master your application TODAY

Visit **www.flowmon.com** to download the free trial and experience how Flowmon APM can help your organization hands on. Get a powerful tool to:

- Unveil application performance issues faster
- Measure and report service level agreements (SLA)
- Get evidence data for capacity planning

End-to-End Visibility

Manage application delivery chain from end to end for each transaction. Distinguish between network, application and database issues and optimize user experience.

No Intrusion

Flowmon APM does not affect infrastructure or applications in any way. It is agentless and fully transparent on the network.

Immediate Value

The setup process allows you to have running real user monitoring in a matter of minutes. Essential reporting mechanisms and metrics come off-the-shelf.

Ease-of-Use

Pre-configured set of tools and reports are available through the user-friendly dashboard. Now everyone can understand the output with the APM index, a single number expressing the overall performance of your application.

"The Flowmon APM gives us the most cost effective opportunity for monitoring our applications. The biggest benefit of this solution is that everything is done without any changes or performance impacts on the application-platform."
